Ex. No.: 4

SQL INJECTION LAB

Aim:

To perform SQL Injection Lab in TryHackMe platform to exploit various vulnerabilities.

Algorithm:

Open the SQL Injection Lab on the TryHackMe platform using the provided link and launch the lab environment.

Start the AttackBox to access the Kali Linux environment required for performing the attacks.

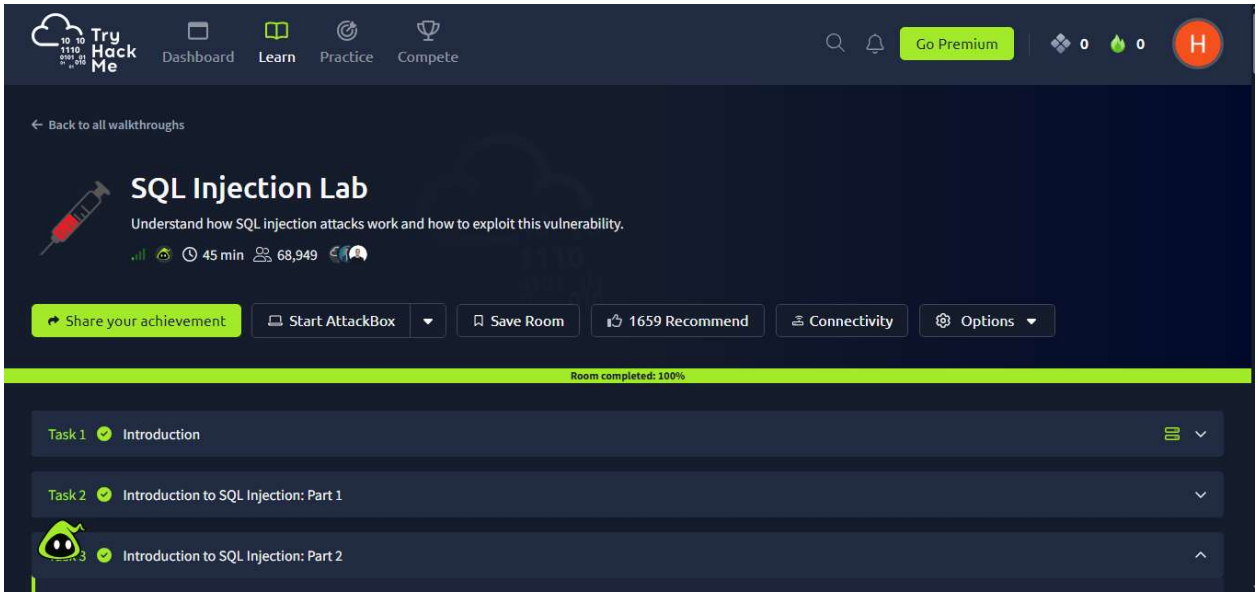

Conduct SQL Injection attacks using different techniques:

- a) Non-String Input Box Injection
- b) String Input Box Injection
- c) URL-Based Injection
- d) POST-Based Injection
- e) Injection through UPDATE Statements

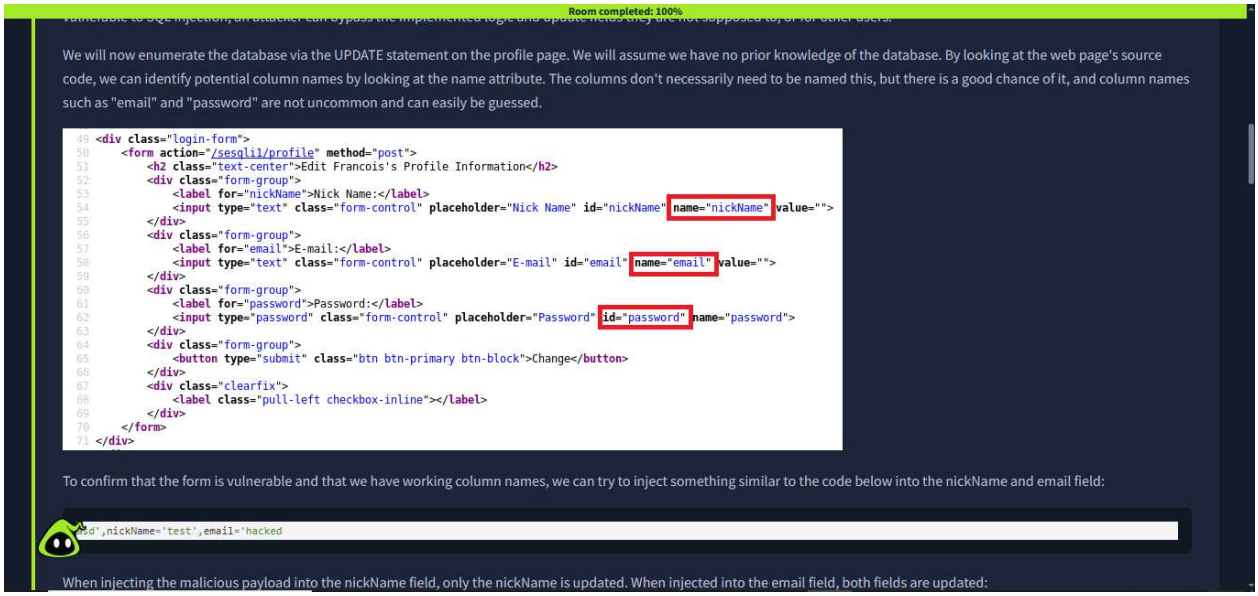

Exploit broken authentication in the login forms using Blind SQL Injection to obtain the administrator's password.

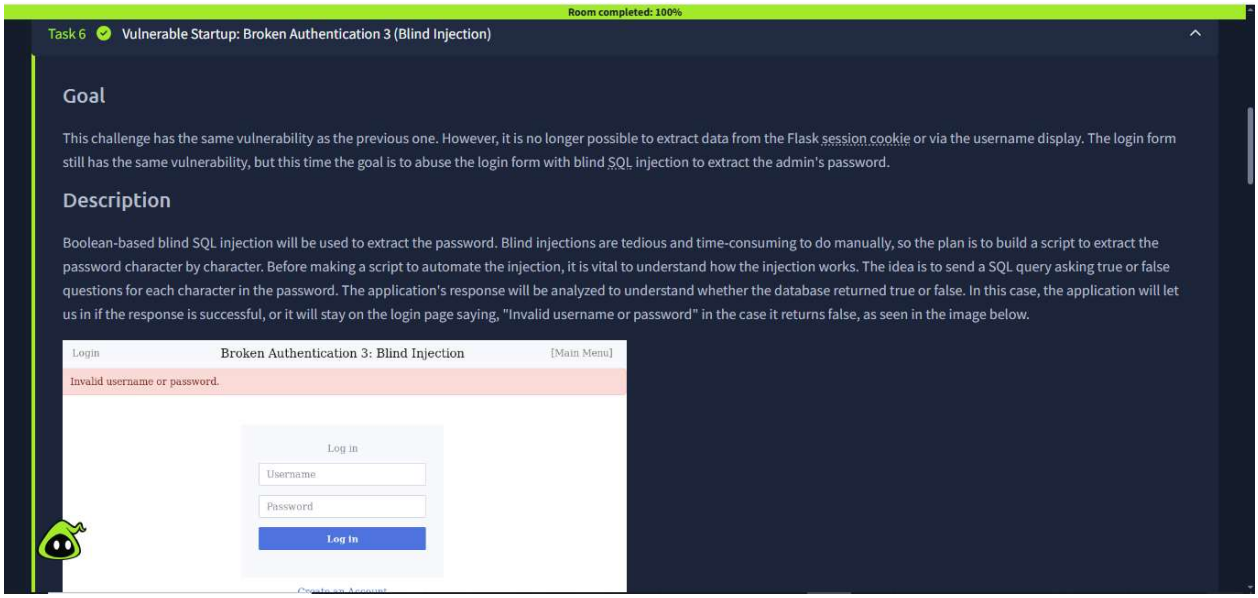

Perform a UNION-based SQL Injection on the vulnerable book search feature to retrieve the required flag.

Output:

Try Hack Me

Task 3 Introduction to SQL Injection: Part 2
SQL Injection Attack on an UPDATE Statement
If a SQL injection occurs on an UPDATE statement, the damage can be much more severe as it allows one to change records within the database. In the employee management application, there is an edit profile page as depicted in the following figure.
Edit Admin's Profile Information

Change
This edit page allows the employees to update their information, but they do not have access to all the available fields, and the user can only change their information. If the form is

Result:

Thus, various SQL Injection attacks were successfully executed to demonstrate the identified vulnerabilities.
